Work Experience

Senior Full-stack Engineer & Tech Lead at Inbox Health

October 2024 - June 2026

- Drove technical execution of a 7-version Ember.js migration, consolidating four repositories into a monorepo, authoring migration scripts and codemods across 13+ module types, resolving cross-engine login flows, and optimizing file conversion with custom Python scripting.
- Re-architected the suite's test-data strategy from a shared live database to integrated fixture-based stubbing with generalized environment configuration, cutting CI runtime in half across all four apps.
- Designed and proposed a fixture schema-validation system that fingerprints API responses into recursive type-trees to catch fixture drift against the live API, converting silent false-positive test passes into immediate, visible failures via opt-in CI validation.
- Built deterministic, automated coverage for five key Stripe-based payment flows by intercepting and stubbing payment requests across four apps.
- Appointed Tech Lead of the newly formed QA team; mentored remote engineers on testing best practices, established standup and regression-review cadence, and defined the testing strategy, ticketing standards, and automated/manual testing balance for the QA team.
- Grew the Cypress E2E suite 300%+ and raised its pass rate from 35% to 90%+ by eliminating flakiness, stubbing database interactions with fixture data, adding targeted regression and smoke tests, and layering in AI-assisted test generation guarded against false positives.

Senior Full-stack Engineer at AgileSix

November 2021 - September 2024

- Eliminated client-side security risks and enhanced data integrity for veteran debt management forms by successfully migrating validation logic from React state management to Ruby on Rails models.
- Secured the reliability of publicly accessed veteran facility data by extending Rails API endpoints to support Next.js pages, including comprehensive data tracking and automated test coverage.
- Accelerated feature delivery and ensured seamless data synchronization by integrating robust React components with Rails API data for critical, high-traffic veteran services.
- Optimized production reliability and test coverage across a complex, legacy codebase by refactoring a multi-framework static build (Drupal, MetalSmith, TypeScript, React, PHP), significantly reducing deployment friction and cutting build times by 45%.
- Guaranteed full legal compliance and digital inclusivity for interactive museum exhibits by implementing strict WCAG 2.1 web accessibility standards, including keyboard navigation and screen reader support.

Summary

Senior Full-stack Engineer and Technical Lead with 10+ years architecting and scaling web applications across React, TypeScript, Next.js, and Ruby on Rails. Proven track record of setting technical direction for modernization initiatives, hardening backend systems and APIs, and leading engineering teams and quality practices across the org. Deep expertise in software architecture, system design, and building reliable products that scale — with a specialty in web accessibility.

Skills

Languages: HTML5, CSS3, JavaScript, TypeScript, Ruby, Python, PHP, MySQL

Frameworks: React, Next.js, Node, Ruby on Rails, GraphQL, Ember, Angular

Tools: Claude, CoPilot, Agentic AI Development, AWS, Docker, Redis, Sidekiq, Sass, aXe

Workflows: CI/CD, TDD, Agile, Scrum, Git, JIRA

Testing: Cypress, RSpec

Standards: WCAG 2.1 & 2.2

Full-stack Engineer at SeeClickFix/CivicPlus

February 2017 - November 2021

- Streamlined full-stack development across React, GraphQL, Ember, TypeScript, and Rails by establishing a new pattern library and design system, reducing inconsistency and accelerating feature delivery
- Expanded Rails API to support multiple new datasets and features for client requests and work orders, increasing platform capability for municipal clients
- Modernized citizen request portal with a responsive, accessible Ember and React front-end, ensuring compatibility with updated API features and improving usability for public-facing users
- Rebuilt company marketing site in WordPress and PHP to support new product launches and improve presentation to prospective clients

Interactive Developer at Alden Image

May 2015 - February 2017

- Built reusable component libraries and design systems in Angular, Sass, and jQuery for clients' internal communications, improving development consistency and maintainability
- Informed client web campaign strategy through Google Analytics reporting, identifying optimization opportunities that shaped content and UX decisions
- Designed and delivered custom WordPress websites for multiple clients, driving improved marketing reach through analytics-informed continuous updates

Notable Projects

Kindle AI Highlight Processor

Personal / Open Source

- Built Python preprocessing pipelines that transform raw, unstructured Kindle highlight source data into clean, structured datasets for downstream AI use
- Integrated LLM tooling and the Notion API to automate generation and delivery of structured outputs

The Searchable Museum

National Museum of African American History and Culture

- Built and refined the museum's digital exhibit experience using Gatsby, including an in-depth interactive exhibit component and refactored main navigation.
- Audited and resolved accessibility bugs to advance WCAG 2.1 compliance across the site.

SeeClickFix Citizen Request Portal

SeeClickFix/CivicPlus

- Designed and built the pattern library and design system underpinning the full citizen request portal from scratch, integrated across Ember, React, and Ruby on Rails.
- Portal enables citizens to submit, track, and explore government service requests with full WCAG 2.1 compliance.

Education

Syracuse University

September 2011 - May 2015

Bachelor of Science

Newspaper and Online Journalism

Minor

Information Technology
